یادداشت:

 pancreatic extract. In a study by [12], it was observed that the administration of the extract increased the secretion of the hormone. These results suggest that the extract may have a beneficial effect on the function of the hormone. Further research is needed to better understand the mechanism of action of the extract and to determine its therapeutic potential. [13] investigated the effects of the extract on the immune system. They found that the extract had a significant impact on the activity of immune cells. Specifically, they observed an increase in the number of activated T-cells and a reduction in the number of suppressor cells. These findings are consistent with the hypothesis that the extract has immunostimulatory properties. Further studies are needed to confirm these results and to elucidate the underlying mechanisms. [14] examined the effects of the extract on the nervous system. They reported that the extract was able to improve cognitive function and reduce anxiety in animal models. These results suggest that the extract may have potential applications in the management of neurological disorders. Altogether, the findings presented in this paper indicate that the extract from the plant has a diverse range of beneficial effects. Further research is needed to explore the potential of this extract in the treatment of various health conditions.
