Abstract:
This study aimed to investigate the frequency of attention deficit hyperactivity disorder (ADHD) among children with functional abdominal pain in Sanandaj. A cross-sectional study was conducted among 150 children aged 5-16 years. The Edinburgh Abdominal Pain Scale and the Conners' Parent Rating Scale were used for data collection. The results showed a higher frequency of ADHD in children with functional abdominal pain compared to the control group. Further research is needed to explore the underlying mechanisms and effective interventions.
