Abstract: The economic sanctions imposed by the US on Iran have had a significant impact on the pharmaceutical industry in Iran. This study aims to investigate the effects of these sanctions on the pharmaceutical industry in Iran. The results of the study show that the sanctions have led to a decrease in the production of pharmaceuticals in Iran, leading to an increase in the prices of medicinal products. The study also highlights the need for the government to take measures to mitigate the effects of these sanctions on the pharmaceutical industry in Iran.
