Dr. Hamed, a nephrologist, conducted a study on children referred to the diagnosis of urine in the nephrology clinic of Bahrami Children's Hospital. The study involved 54 patients with a mean age of 7.8 years. The most common causes of urinary tract diseases were: urinary tract infection (UTI), gender (male, 32 children) and age (child, 39 children). The response to treatment in patients with UTI was excellent in 40 children and fair in 9 children. The response to treatment in patients with gender was excellent in 15 children and fair in 17 children. The response to treatment in patients with age was excellent in 15 children and fair in 24 children. The study indicates that UTI is the most common cause of urinary tract disease in children referred to the nephrology clinic of Bahrami Children's Hospital.
