Immunohistochemistry evaluation and comparison in invasive breast cancer female patients under 35 years and upper 35 years referred to Shariati hospital and Tehran Cancer institute between 2015-2018

Prof. Mohammad Reza Dehpishesh, MD

Dear Professor, 

I would like to inform you about a new study we have conducted on the evaluation and comparison of immunohistochemistry techniques in invasive breast cancer patients under 35 years and upper 35 years referred to Shariati Hospital and Tehran Cancer Institute between 2015-2018.

The study aimed to evaluate the concordance and agreement of immunohistochemistry techniques used in the diagnosis of invasive breast cancer. The results showed that there were significant differences in the concordance and agreement of immunohistochemistry techniques between the two age groups.

We believe that this study can provide valuable insights into the diagnosis and treatment of invasive breast cancer. We would appreciate it if you could consider this study for publication in a reputable journal.

Sincerely,

[Your Name]
