**Abstract:**

Objective: The aim of this systematic review and meta-analysis was to investigate the association between peri-implantitis and risk factors.

Methods: We conducted a systematic review and meta-analysis of studies that evaluated the association between peri-implantitis and risk factors. We included studies that used a standardized protocol for data extraction.

Results: A total of 10 studies were included in this meta-analysis. The results showed a significant association between peri-implantitis and risk factors, including smoking, diabetes, and systemic disease.

Conclusion: Peri-implantitis is a complex disease that is associated with multiple risk factors. Further research is needed to identify the most important risk factors and to develop effective interventions to prevent and treat peri-implantitis.
